

## Project Documentation

### Purpose

To test the ability to generate non-technical project documentation using mark-down syntax

### Directions

For a project of your choice that you have implemented for this course (**but not Project 4**), you are going to create a Project Document. For your project, create or use a file named `README.md`. A file that uses the `.md` file extension can use `markdown` syntax to create a well formatted document. In addition to using `markdown` for formatting, your Project Document must contain:

`# Project Title`

`## Project Description`

Describe what the purpose of the project is. Include what it does in summary and what programming concepts it reinforces

`## Project Guide`

`### Dependencies`

To run your code, what does a user need to have installed?

`### How to run the project`

If they have things installed, how can they run your project?

`### How to play the game`

Tell a user how to play your game. Be sure to add special details if you implemented something extra!

`## Lessons Learned`

Tell us what you learned along the way. Examples include:

- what concepts you practiced / better understood
- bugs you detangled
